Podcast Ecosystem Radar — Components Map

10 shows (YouTube + podcast RSS) → daily scores → Monday brief → Aditya decides

Code does the maths | Gemini Flash does the reasoning | Aditya decides | The system never contacts anyone | Free tiers only

What changed from the first version

1. Shows come from YouTube and podcast RSS feeds. Aditya adds or removes them (max 10) on the dashboard, no code. A new show is read at once; removing one updates the dashboard in seconds.
2. Thin data fixes itself: a show with few guest episodes gets its podcast feed attached (Apple free directory); up to 3 shows may be added.
3. Guests are ranked on their own, not per topic. Founders only. Media round = same guest on 2+ shows within 30 days.
4. Topics: exactly 6, the ones the most shows cover at the same time (last 30 days), grouped by audience response, never padded.
5. Plain ratings instead of raw percentages: topics (High, Steady, Mixed response), guests (Top, Strong, Good lead), sponsors (Active, Possible advertiser), each with its reasons.
6. One-click Find links for guests and sponsors: Google first, then LinkedIn, X, Instagram, plus a checked company website when the episodes name one.
7. Review Gate: shortlist, dismiss, contacted, Confirmed, sponsored, CSV, and a Your shortlist block that also appears in the Monday email. It sends nothing.
8. Fallback chain: live data → last good snapshot → demo data, labelled in a banner. One refresh a day plus the Monday brief. CI must pass before deploy.
