Podcast Ecosystem Radar — Components Map

10 shows (YouTube + podcast RSS) → daily scores → Monday brief → Aditya decides

Code does the maths | Gemini Flash does the reasoning | Aditya decides | The system never contacts anyone | Free tiers only

What changed from the first version

1. Shows come from YouTube and from podcast RSS feeds. Aditya adds or removes them (max 10) on the dashboard, no code.
2. Thin data fixes itself: a show with few guest episodes gets its podcast feed attached (Apple free directory); up to 3 shows may be added.
3. Founders are ranked on their own, not per topic. Founders only. Media round = same founder on 2+ shows within 30 days.
4. Topics are ranked by how many shows cover them at the same time (last 30 days). Exactly 6, never padded.
5. Review Gate: shortlist, dismiss, contacted, Confirmed (removes a guest from the list), sponsored. CSV export. Sends nothing.
6. Fallback chain: live data → last good snapshot → demo data, labelled in a banner. Two crons (daily, Monday). CI must pass before deploy.
